NOT TO BE TAKEN

The rapid spread of professional interest in contraception has emphasised the necessity of care in selection of the method employed and examination of the clinical data available on the product offered.

In presenting "LOMOLO" to the Medical Profession, a "NAPP" product is brought forward which has passed through the experimental stage and is already widely employed under medical supervision in the leading Birth Control clinics in this country.

"LOMOLO" is specifically intended as a contraceptive but the use of such a preparation otherwise than on the instructions of a physician is to be deprecated. The reason for this is not because "LOMOLO" is dangerous or harmful to the tissues, but because the necessity for control in such a matter as conception, and the means to that end, should only be decided upon the advice of the physician. We therefore introduce **"LOMOLO" only to members of the Medical Profession.**

"LOMOLO" is an accurately proportioned and well balanced compound of Oxyquinoline Sulphate, Zinc Sulphocarbolate and a suitable effervescent base. This combination of ingredients is definitely prophylactic, antiseptic and deodorant. When placed in the vagina, contact

with the secretions sets up a chemical reaction between the ingredients of the tablet, and a voluminous and lasting foam is rapidly produced, with liberation of oxygen. There is no residue of a caustic nature which would cause injury to the mucous membrane.

The preventive action of "LOMOLO" is both mechanical and chemical; the mass of foam induces a definite surface tension of the vaginal membrane, and spreads to form a protective coating, impenetrable to micro-organisms, whilst the chemicals contained in the foam, and the oxygen liberated exert a spermicidal and antiseptic action.

The prophylactic and antiseptic properties of "LOMOLO" have been exhaustively tested and pronounced satisfactory for the purpose for which the tablet is intended.

"LOMOLO" constitutes a decided advance upon contraceptives hitherto advocated. Mechanical devices (Pessaries, Condoms, etc.) have objections both æsthetic and practical; products containing cocoa-butter are greasy and objectionable, and chemically-acting contraceptives may produce detrimental effects upon the mucous membrane should a corrosive residue or by-product result from the interaction of the chemical components.

There are no objectionable features in the use of "LOMOLO," and it is reliable and harmless.

"LOMOLO" is presented in a discreet and unobtrusive packing, with no outward indication of its use.

DIRECTIONS

In all cases use according to directions of the Physician. Place the tablet as far back as possible in the vagina before each occasion. If there be any dryness of the vagina the tablet should be dipped in water immediately before inserting. About two or three minutes should be allowed to elapse so that the tablet can entirely dissolve.

Douching may be carried out some few hours afterwards.

Always replace the cap of the bottle firmly and keep in a dry place.

PACKING and PRICE in London
